

Knowledge Driven Risk Management

DSAC Symposium – Novembre 24th, 2011

“From event processing to risk management”

Andrew Rose – on behalf of UK CAA

Data verses Knowledge

We have huge amounts of data that has the potential to tell us how our 'system' is performing

but we use it in a piecemeal way

so what it tells us through its individual parts is nothing compared to what it would tell us as part of a **homogenous picture**

Effective Risk Management

Effective risk management requires us to monitor the performance of our system

But it also requires us to understand what affects that performance and how we can influence it

*Our responsibility is to ensure that we make best use of the data available to enable **optimum risk management decisions***

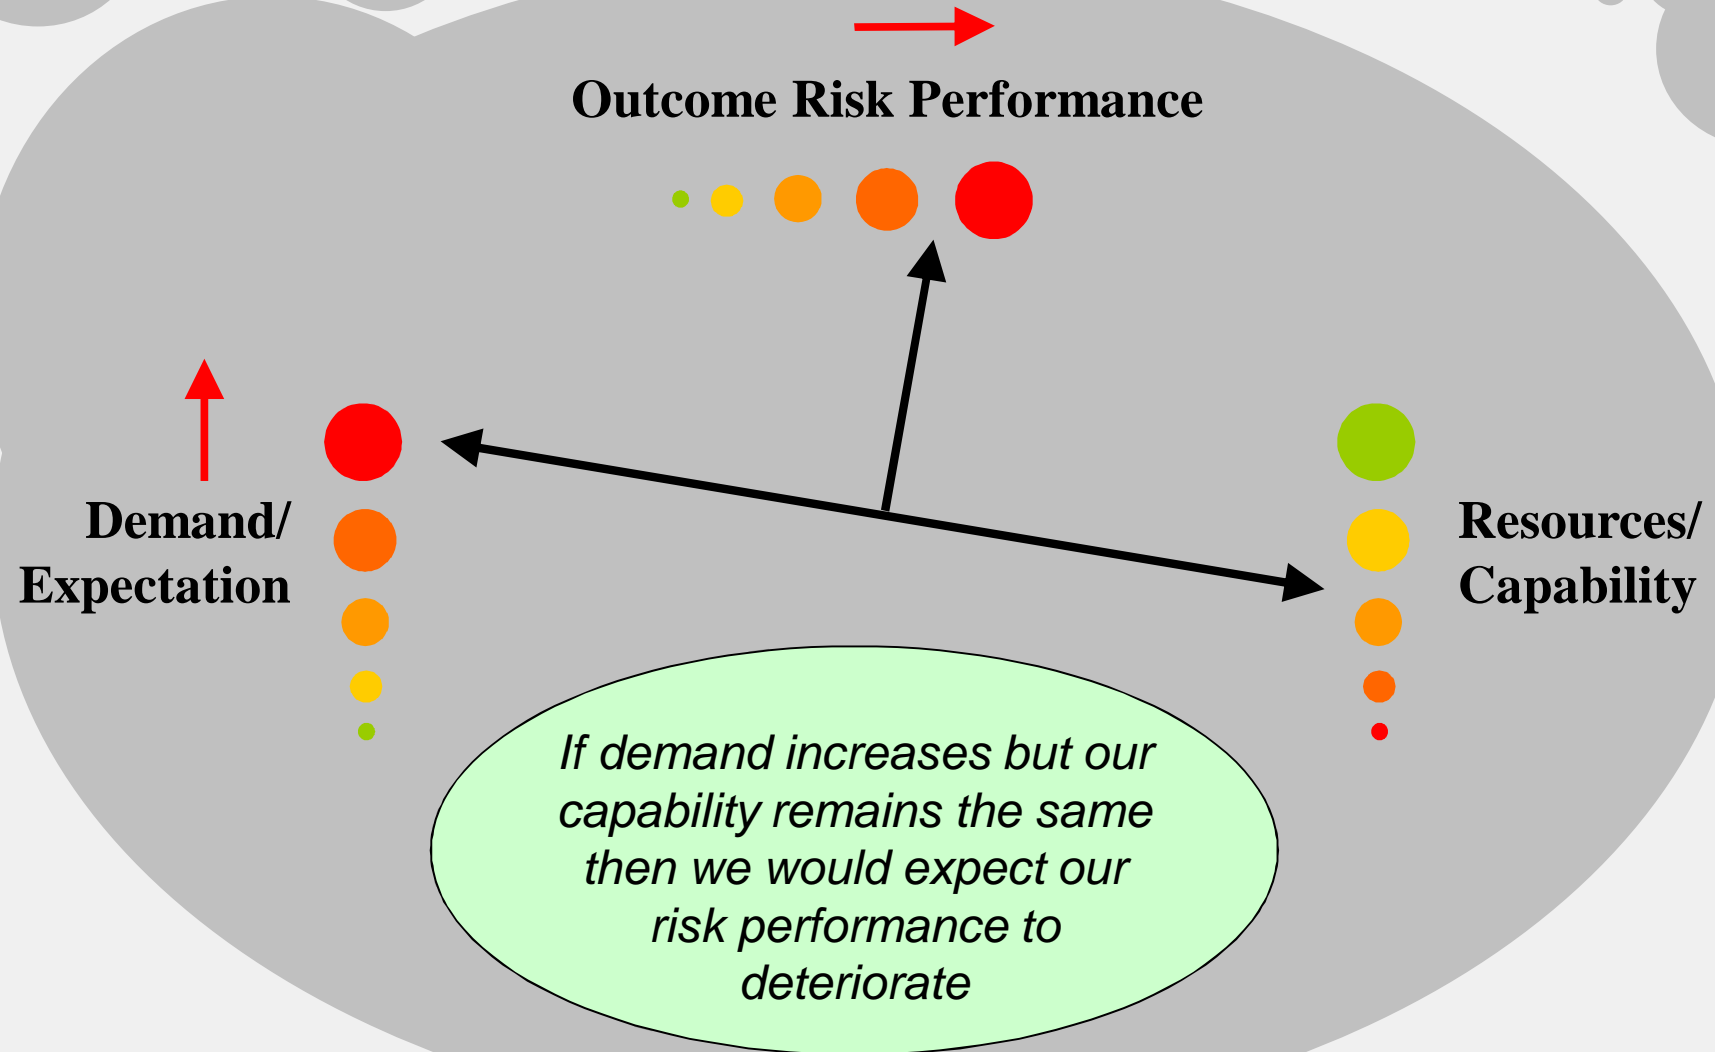

A Systems Perspective

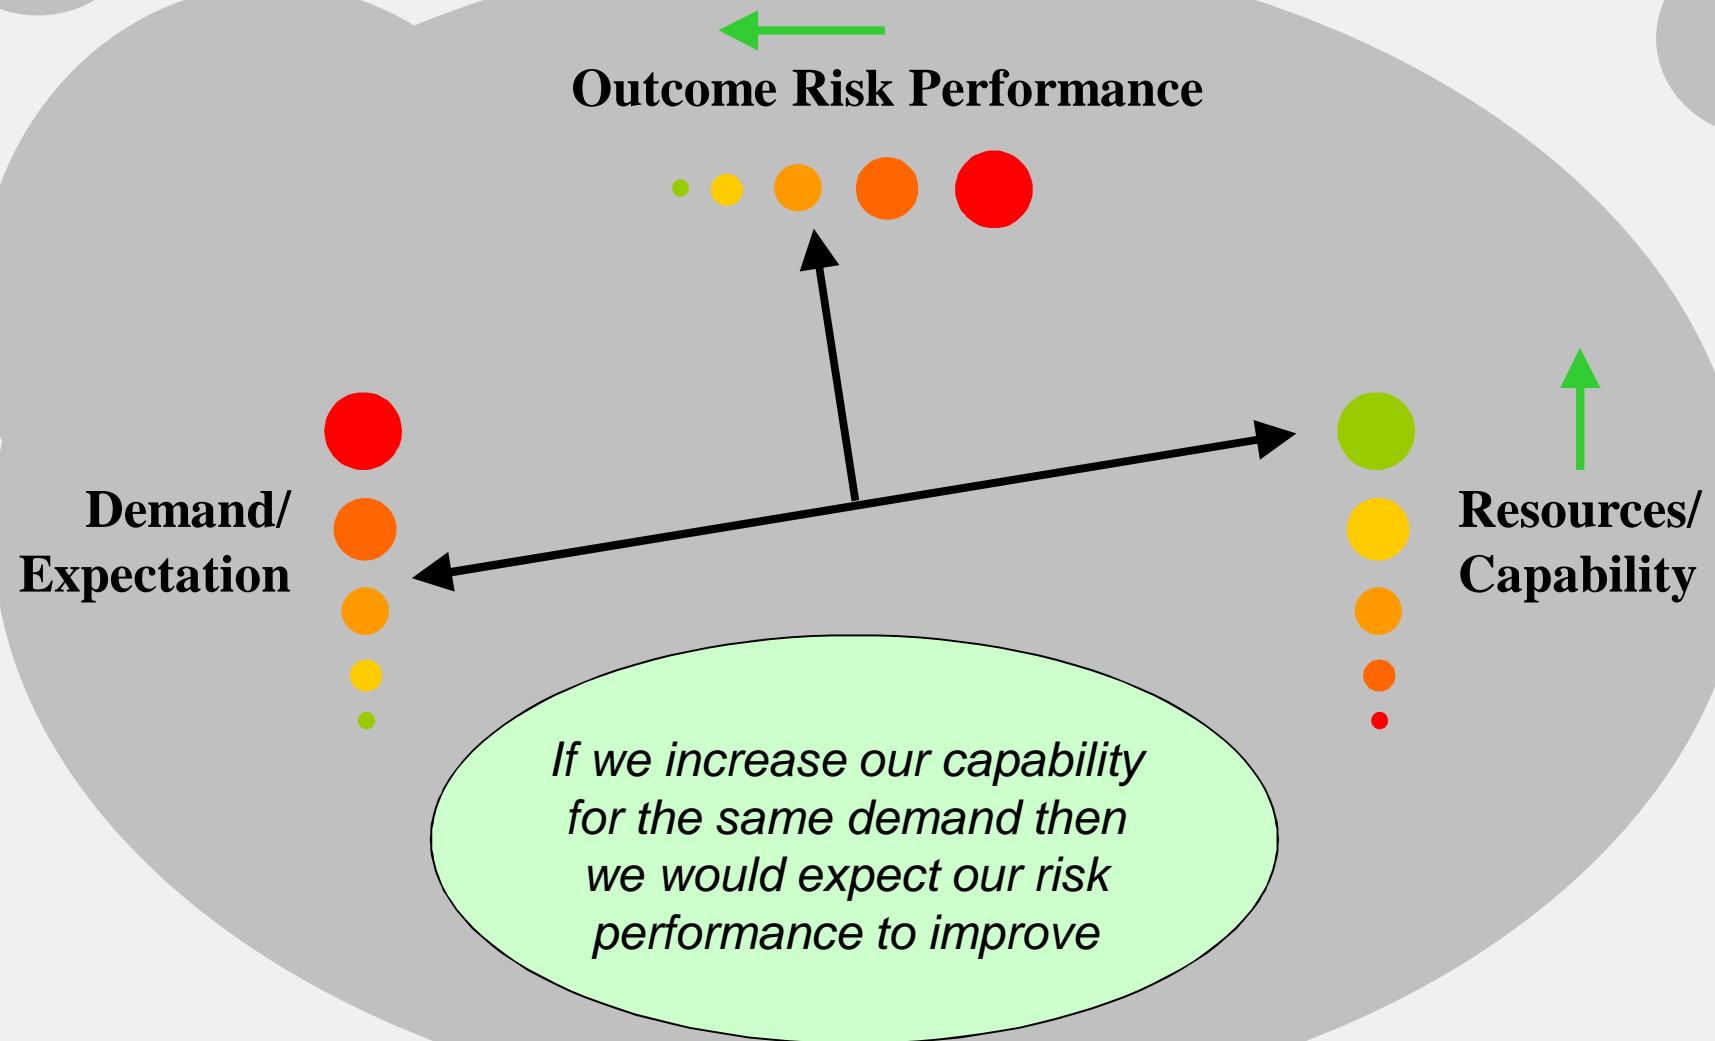

A Risk Management Perspective

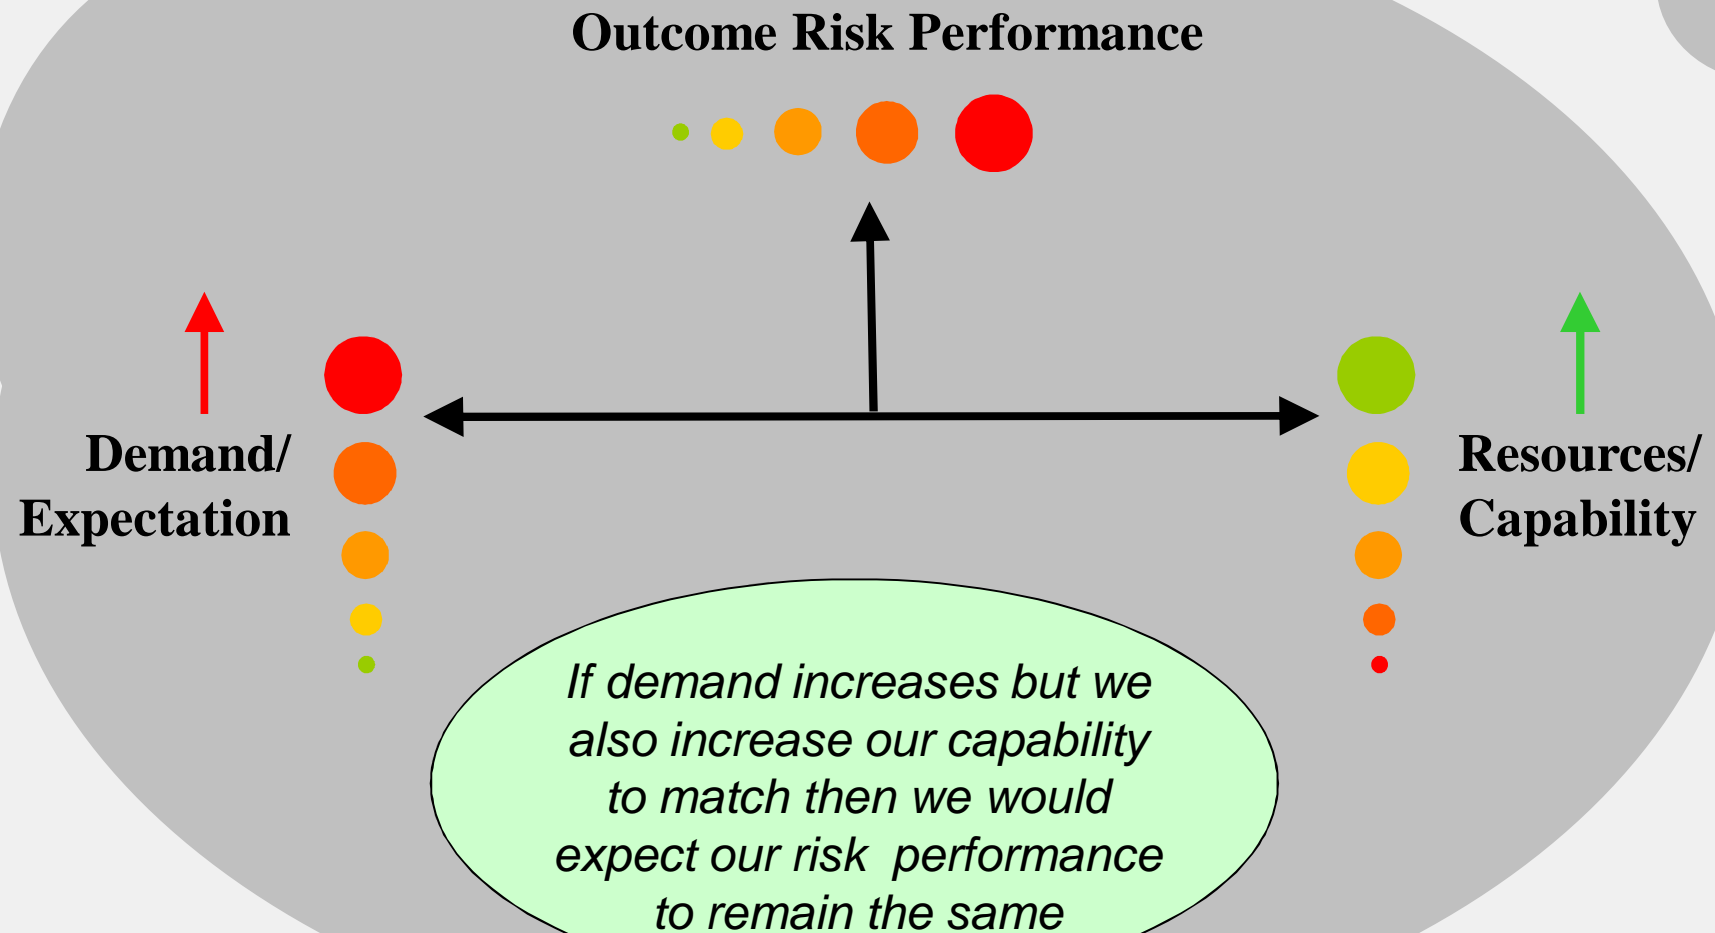

A Risk Management Perspective

A Risk Management Perspective

A Risk Management Perspective

Consolidated Risk Picture

By identifying data and measures to support each of these three variables in the system we can bring them together to form a Consolidated Risk Picture

Enabling really effective risk management at any level*

** The concept is scalable from the individual right up to the global system level*

Demand/
Expectation

Performance

Resources/ Capability

Historically, as an industry, we have spent most of our time, and effort, in the 'outcome' performance area and within that we have concentrated further still on using employee reporting data

However we are increasingly interested in 'system generated' data but in the context of 'another view'

We should be striving for a better picture: a cohesive picture...

Data verses Knowledge

Employee reporting data is a rich source of information but is narrow in its scope

System generated data is often lacking in detail but wide in its coverage

combined they become a powerful source of system performance knowledge

"The whole is greater than the sum of its parts." - [Aristotle](#)

A BIG Picture

But there is more...

If we are really interested in a 'big picture' then we not only need to look **deeper** within our domains but also **wider** across the functional and global aviation domain

A truly integrated aviation system needs an integrated view of risk performance

"The whole is greater than the sum of its parts." - [Aristotle](#)

Understanding Risk

The key to bringing these wide sources of data together is a common understanding:

all these adverse events allude to **risk**;
risk in terms of the likelihood of an accident
outcome occurring

*Hence they share a commonality that allows
us to place them in a common 'risk space'*

The shared Risk Space

ARMS Event Risk Classification (ERC) Framework

What was the effectiveness of the remaining barriers between this event and the accident scenario?

EFFECTIVE LIMITED MINIMAL NOT EFFECTIVE

If this event had escalated into an accident, what would have been the most credible accident outcome?

2 ★	20 ★	200	2000 ★
1	10	100 ★	1000
0.1	1	10	100 ★
0.01			

Catastrophic accident with multiple fatalities >8

1-8 fatalities, multiple serious injuries, major damage/loss to the aircraft

Minor injuries, minor damage to aircraft

No potential damage or injury could occur

Probability of the incident progressing to the credible accident outcome

Subjective

Wholly dependent upon individual user's knowledge of the system and the event

Simply asking the question how close it was to the accident

Comparing the incidents to a menu of typical incidents to select the probability

Question how many barriers remain

Question the effectiveness of the remaining barriers

Use Expert knowledge to determine the importance of the barriers in the scenario and then challenge those barriers that remain

Developing a fault tree for the system and using system measures to determine how far through the tree the event is

Objective

Wholly dependent upon a predefined model of the system and precise knowledge of the nature of the event and the occurrence rate of its components

Building a complete system model (Bayesian Network?) and letting the model answer the question

ECAST – Common Risk Classification Framework

Barrier models provide an ‘accessible’ way to evaluate the probability of an event progressing to an accident (*Safety Margin*)

- Q.** *What barriers stopped this event progressing?*
- *What other barriers could also have stopped this event progressing?*

How reliable are those barriers?

Building upon:
Risk Analysis Tool (RAT)
Analytical Hierarchy
Process from the APF

Formulating a Barrier Model

- » Scenario – system has three barriers and a $\text{Prob}_{\text{OUTCOME}}$ of 10%, thus the barriers stop 90% of all undesirable operational states becoming an undesired outcome

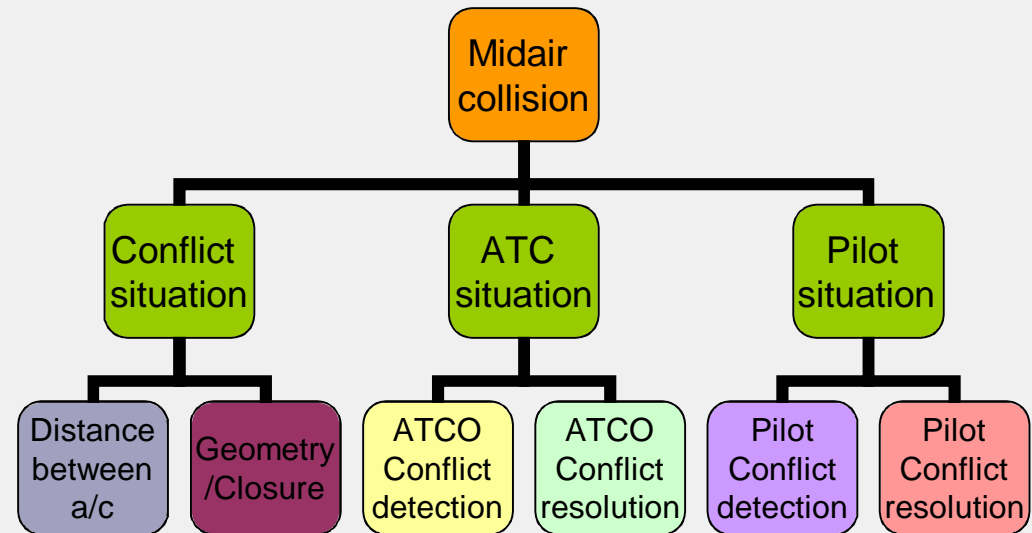

So what happens if Barrier A is eroded or does not exist?

The Eurocontrol 'RAT'

Unmitigated collision risk		Controllability			
Conflict circumstances		Ground controllability		Airborne controllability	
Separation	Closure	ATC Detection	ATC Resolution	Airborne detection	Airborne resolution
1. Risk of collision		ATM ground		ATM airborne	
Minimum separation achieved		0		0	
Separation > 75% minimum		1		1	
Separation > 50%, ≤ 75% minimum		3		3	
Separation > 25%, ≤ 50% minimum		7		7	
Separation ≤ 25% minimum		10		10	
Total separation (a)					
Rate of closure NONE		0		0	
Rate of closure LOW (≤ 89knots, ≤ 1000ft/min)		1		1	
Rate of closure MEDIUM (> 85 and ≤ 205 knots, > 1000 and ≤ 2000 ft/min)		2		2	
Rate of closure HIGH (> 205 and ≤ 700 knots, > 2000 and ≤ 4000 ft/min)		4		4	
Rate of closure VERY HIGH (> 700knots, > 4000ft/min)		5		5	
Total rate of closure (b)					
TOTAL (1-ATM) Risk of Collision (a)•(b)		0			
TOTAL (1-ATM Ground) Risk of Collision (a)•(b)		0			
2. Controllability		ATM ground		ATM airborne	
Conflict detected		0		0	
Conflict detected late		3		0	
Conflict NOT detected		5		0	
Plan CORRECT		0		0	
Plan INADEQUATE		3		0	
NO plan		5		0	
Execution CORRECT		0		0	
Execution INADEQUATE		3		5	
NO execution		5		10	
Current STCA triggered		3		0	
NO STCA warning		5		0	
Recovery CORRECT		0		0	
Recovery INADEQUATE		5		6	
NO recovery or the ATM ground actions for recovery have worsened the situation or ATM airborne has worsened the situation		10		15	
TCAS triggered (useful RAs only to be considered) or see and avoid pilot decision (in the absence of TCAS)		10		0	
NO TCAS RA		0		10	
Pilot(s) followed RA (or, in absence of RA, took other effective action, as a result of see and avoid decision)		0		0	
Pilot(s) INSUFFICIENTLY followed RA		0		10	
Pilot(s) INCORRECTLY followed RA (or, in the absence of RA, took other inadequate action)		0		15	
TOTAL (2-ATM) Risk of Collision (a)•(b)		TOTAL (2-ATM Ground)		TOTAL (2-ATM Airborne)	
		0		0	

Example output from Midair collision work

ARMS ERC and the Common Risk Classification Framework

What was the effectiveness of the remaining barriers between this event and the accident scenario?

If this event had escalated into an accident, what would have been the most credible accident outcome?

EFFECTIVE LIMITED MINIMAL NOT EFFECTIVE

2	20	200	2000
1	10	100	1000
0.1	1	10	100
0.01			

Catastrophic accident with multiple fatalities >8

1-8 fatalities, multiple serious injuries, major damage/loss to the aircraft

Minor injuries, minor damage to aircraft

No potential damage or injury could occur

The Output

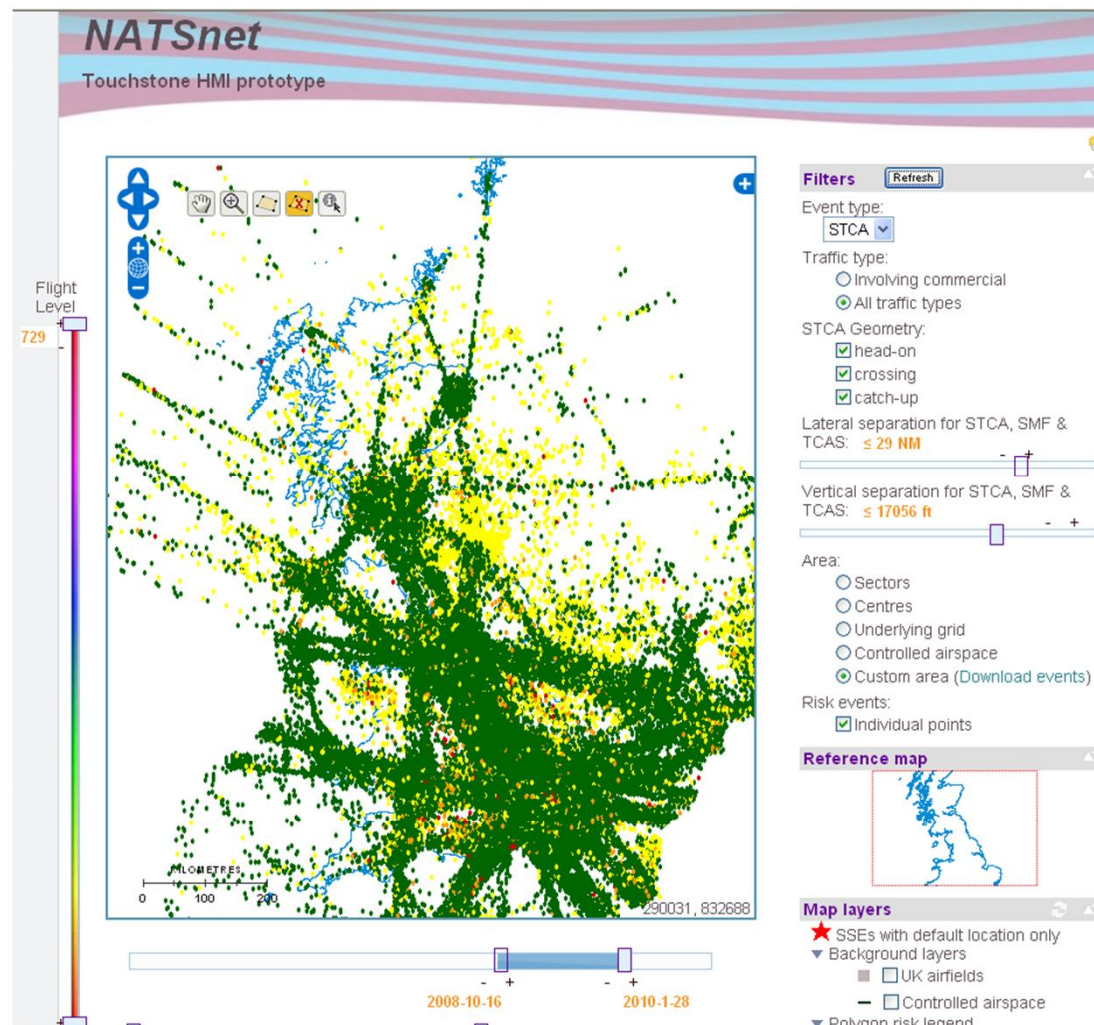

A common way to assess outcome probability: CRCF barrier model approach
+ application to the ERC risk space
= a comparable and combinable output in terms of **risk** with which...

Conclusion

The key to effective Risk Management is *knowledge* of how our system functions and how it is performing

We need a better, and bigger, *Risk Picture* for outcome performance: bigger means both depth (data) and breadth (industry)

The ECAST CRCF work is an enabler to a common risk performance space that will facilitate that bigger picture
